表4 COI、16S rRNA、H3和28S rRNA基因片段的碱基频率

Tab. 4 Nucleotide frequencies of COI、16S rRNA, H3 and 28S rRNA gene fragments

gene	/% base composition				GC含量/% GC content
	胸腺嘧啶(T)	胞嘧啶(C)	腺嘌呤(A)	鸟嘌呤(G)	
COI	38.82	17.98	20.01	23.19	41.17
16S rRNA	30.02	13.94	28.98	27.07	41.01
H3	17.21	31.20	23.41	28.17	59.37
28S rRNA	16.95	28.24		35.72	63.96

表5 COI、16S rRNA、H3和28S rRNA基因片段的遗传多样性参数

Tab. 5 Genetic diversity parameters of COI, 16S rRNA, H3 and 28S rRNA gene fragments

gene	number of haplotypes	haplotype diversity	average nucleotide difference	nucleotide diversity
16S rRNA	20	1.0000	52.5842	0.4045
28S rRNA	14	0.9130	37.7546	0.0569
COI	23	0.9399	63.7721	0.4141
H3	22	0.9388	18.3620	0.0673

16S rRNA基因片段共有130个位点，其中129个保守位点，1个变异位点，转换/颠换26对，R=3.042；28S rRNA基因片段共有154个位点，128个保守位点，26个变异位点，转换/颠换21对，R=1.480；而就基因序列变异数目而言，COI基因片段共有154个位点，153个保守位点，1个变异位点，转换/颠换，R=5.073；H3基因片段共有56个位点，52个保守位点，4个变异位点，转换/颠换，R=1.564。COI和H3基因片段相对较为保守，而两者相对比较，3个变异位点。

COI基因片段的9个种群内遗传距离，0~0.016，种群间遗传距离0.087~0.331,

种群平均遗传距离0.087；8个亚种间，平均遗传距离0.258；8个亚种内平均遗传距离0.219(表6)。16S rRNA基因片段的种群内遗传距离0.001~0.011，种群间遗传距离0.008~0.393，种群平均遗传距离0.008；8个亚种间，平均遗传距离0.318；8个亚种内平均遗传距离0.245(表7)。H3基因片段的种群内遗传距离0~0.009，种群间遗传距离0.004~0.140，种群平均遗传距离0.004；8个亚种间，平均遗传距离0.129；8个亚种内平均遗传距离0.091(表8)。28S rRNA基因片段的种群内遗传距离0~0.019，种群间遗传距离0.006~0.191，8个亚种间平均遗传距离0.136；8个亚种内平均遗传距离0.064(表9)。

在4个基因片段中，1个，COI基因片段90.70%，适合选取GTR模型[21]，COI基因片段14.06%，H3基因片段53.85%，3.89%，适合GTR模型，而16S rRNA和28S rRNA基因片段，COI基因片段[22]使用SequenceMatrix软件将COI、16S rRNA、H3和28S rRNA基因片段，gap共1555 bp，T12(data T12)，使用PAUP 4.0b10对T12进行4，P=0.096，T12[23]

Phylogenetic relationships among *Sanguinolaria* species in the coastal waters of China

JIANG Lisha, LI Qi, KONG Lingfeng

Key Laboratory of Mariculture, Ministry of Education; Ocean University of China, Qingdao 266003, China

Abstract: Fragments of the mitochondrial gene (COI and 16S rRNA) and the nuclear marker (H3 and 28S rRNA) regions are suitable for phylogenetic relationship analysis. The phylogenetic relationships among nine *Sanguinolaria* species (*Sanguinolaria acuta*, *S. chinensis*, *S. diphos*, *S. ovalis*, *S. virescens*, *S. elongata*, *S. minor*, *S. olivacea,* and *S. tchangsii*) collected from the coastal areas of China was analyzed through the sequencing of COI, H3, 16S rRNA, and 28S rRNA genes. The two mitochondrial genes, COI *and* 16S rRNA, had an obvious AT-skewness, and their GC content were 41.17% and 41.01%, respectively, showing a certain degree of base preference. The overall transition/transversion bias of the four fragments (COI 5.073, 16S rRNA 3.042, H3 1.564, and 28S rRNA 1.480) were much higher than the critical value (0.4), which could offer effective phylogenetic information. As the genetic diversity parameters of all four markers in nine *Sanguinolaria* species had higher values ($Pi<0.05$, $Hd<0.5$) than most bivalve species, it is suggested that the *Sanguinolaria* species may have long history in the localities, and sufficient phylogenetic information. Among the nine *Sanguinolaria* species, the genetic average distances based on the COI gene were 0.087–0.331, and the genetic distances within species were 0–0.016. The minimum genetic distance was between *S. ovalis* and *S. chinensis*, which was much higher than the average value (0.005) between most species of bivalves. The saturation of the nucleotide substitution process in the four markers was calculated as well. The third codon positions of the COI gene's transition and transversion substitutions reached the point of saturation, which means that the third codon positions of the COI gene could not provide effective information. The combined data set T12, including the four molecular markers without the third codon positions of COI, totaled 1555 bp in length. Phylogenetic trees constructed by the Maximum Likelihood (ML) and Bayesian Inference (BI) methods were consistent, and cluster analysis based on the data set T12 showed three separate lineages, corresponding to three morphologically defined subgenera: *Hainania*, *Nutallia,* and *Psammotaea*. Combining morphological and molecular evidence, the results support that *S. ovalis* and *S. chinensis* has the closest phylogenetic relationship. The study sheds light on the genetic diversity and phylogenetic relationship of *Sanguinolaria* species occurring along the coast of China, which may be useful in genetic resource protection and sustainable use.

Key words: *Sanguinolaria*; COI; 16S rRNA; H3; 28S rRNA; phylogenetic relationship
